

Fatigue and fracture

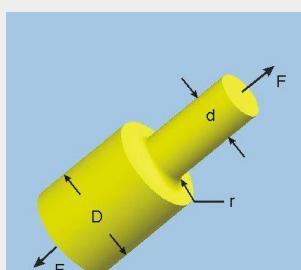

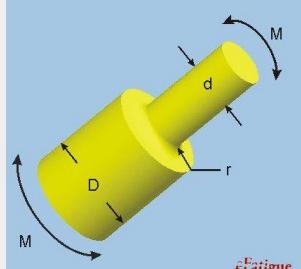

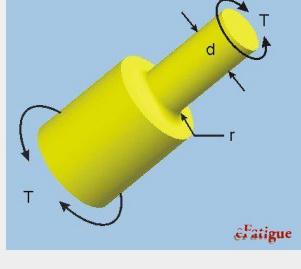

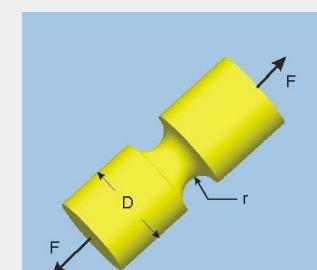

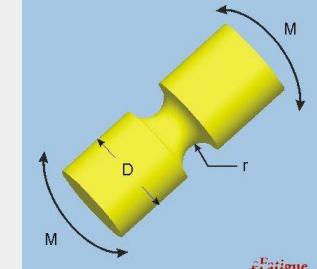

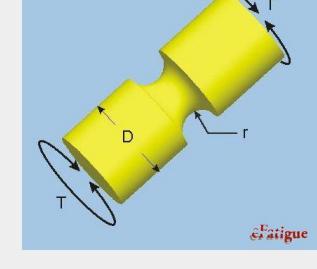

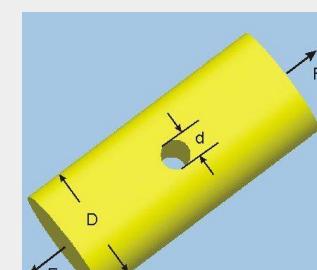

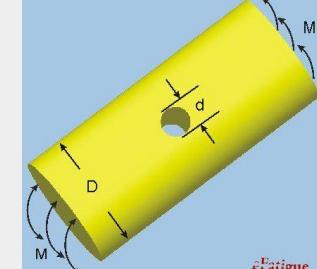

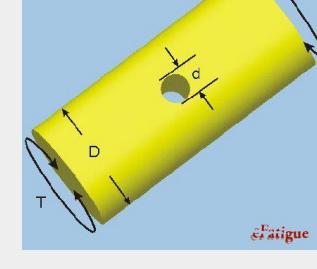

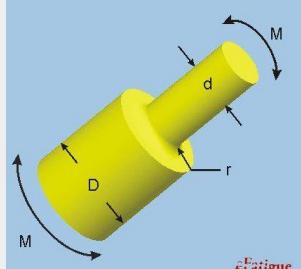

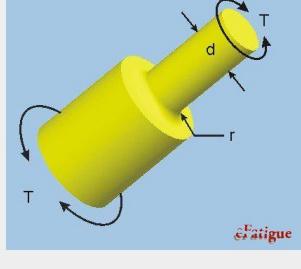

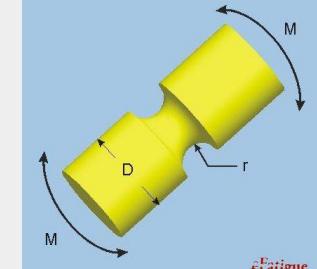

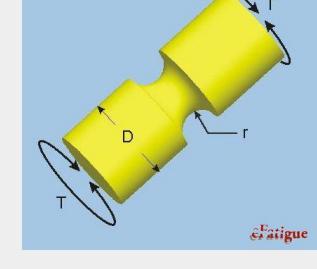

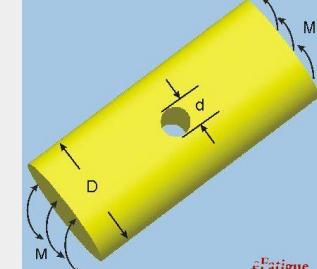

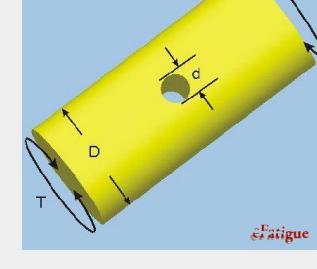

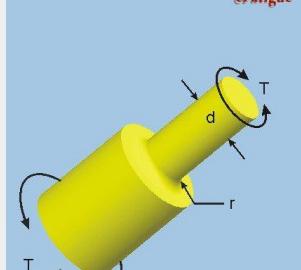

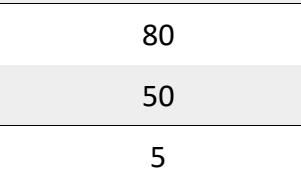

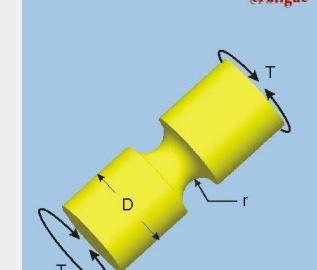

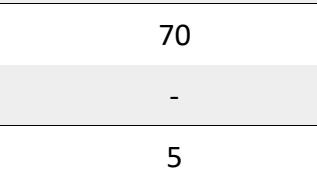

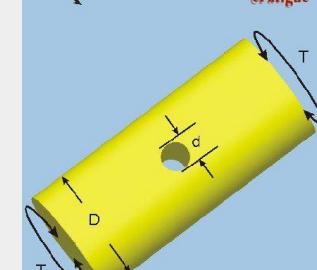

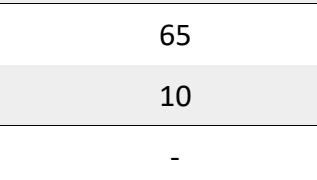

Homework

The depicted part is subjected to a cyclic loading. The ultimate aim of the homework is to predict the expected lifetime of the part by the strain-life method. The figures and the personal code determine the exact problem in geometry, loading and material order. Subtasks:

- (i) Find the critical cross-section and critical point of the part (maximum stress).
- (ii) Create the cyclic flow curve of the material.
- (iii) Plot the Neuber-hyperbola for the given geometry.
- (iv) Determine the maximum strain at the critical point.
- (V) Create and plot the unified S-N curve for the given material.
- (vi) Predict the expected lifetime of the part, define the characteristic of the failure mode.

The detailed, explained and commented documentation with descriptions, equations and plots, prepared by engineering fastidiousness should be sent via e-mail to orbulov@eik.bme.hu under the filename of <Given name_First name_Neptun code.pdf>.

Deadline: 6th December 2024. 12:00.
